

Q3

1/1 point (ungraded)

Consider table R with owner A. Suppose we have the sequence: (1) A grants select(R) to B with grant option; (2) A grants select(R) to C with grant option; (3) B grants select(R) to D; (4) C grants select(R) to D; (5) A revokes select(R) from B with restrict. Does step (5) generate an error?

☐ Yes

☒ No

Explanation

Cascade would not revoke any privileges, because the one privilege B granted (select(R) to D) was also granted by C.
